Wedding Event Management System: Features & Tips

Oct 22, 2026 · @Chanthy Developer

Who the system is for

The first decision is the audience, because it changes scope, data model and permissions.

Audience	Scope	Key needs
Couple-facing app	One wedding	Guests, RSVP, budget; simpler build
Wedding planner / venue business	Many weddings	Clients, staff, vendors, invoices; multi-tenancy and roles

Core features

Ten modules cover a full wedding; guest list, RSVP, check-in and budget form the MVP.

1. Event and schedule management

- Multiple ceremonies per wedding (engagement, ceremony, reception, multi-day rituals)
- Timeline per day with time slots, location and responsible person
- Run-of-show view for the day itself

2. Guest management

- Guest list with groups or families, side (bride or groom), relationship and contact info
- Import from Excel or CSV, since most people start with a spreadsheet
- Plus-ones and children counts
- Tags: VIP, dietary needs, needs transport or accommodation

3. Invitations and RSVP

- Digital invitation page with a unique link or QR code per guest or family

- RSVP form: attending, number of people, meal choice
- Reminders via SMS, email, Telegram or WhatsApp
- Live RSVP dashboard

4. Seating and tables

- Drag-and-drop seating chart
- Table capacity checks and conflict warnings
- Printable table cards and guest lookup ("which table am I?")

5. Check-in on the day

- QR scan at the entrance, from a phone
- Offline mode, because venue Wi-Fi is unreliable
- Live headcount against expected guests

6. Gift and cash envelope tracking

- Record who gave what (cash amount or item) per guest
- Totals and export for thank-you notes and later reciprocity
- Restricted to trusted roles, as the data is sensitive

7. Budget and payments

- Budget by category: venue, food, decoration, photo, attire
- Estimated vs actual, deposits and due dates
- Payment reminders

8. Vendor management

- Vendor directory with contracts, contact person and payment status
- Vendors assigned to timeline items

9. Tasks and checklist

- Planning checklist with deadlines (for example "6 months before")
- Tasks assigned to family members or staff

10. Media

- Guest photo upload via QR code into a shared gallery

Tips

- **Build an MVP first:** guest list, RSVP, check-in and budget deliver most of the value. Seating charts and galleries can wait.
- **Model Wedding → Event (ceremony) → Guest attendance.** A guest may attend some ceremonies but not others; fixing this later is painful.
- **Mobile-first for guests and day-of staff.** The admin side can be desktop-heavy.
- **Local language and currency from the start:** i18n, and multiple currencies if cash gifts mix USD and local currency.
- **Role-based access:** owner or couple, planner, staff (check-in only), family helper (gift recording).

Angular-specific suggestions

- **Separate apps or lazy-loaded areas:** a lightweight public guest app (invitation and RSVP, with SSR for link previews in chat apps) and an admin app.
- **NgRx** for the admin side, where guests, seating and budget share a lot of state. Signals alone are enough for the guest RSVP page.
- **Offline check-in:** a PWA with a service worker plus IndexedDB, syncing when back online.
- **Seating chart:** Angular CDK drag-drop.
- **Backend with real-time support** (Supabase, Firebase, or NestJS with WebSockets) so RSVP and check-in dashboards update live.

Open question: is this for a couple's own use or for a planner or venue business?
